ABSTRACT

Gym Management System is an online service that can be setup for your gym to help manage classes, memberships, receive payments (merchant and cash), keep track with detailed statistics, customer management, surveys and it even has an online store so you can sell products to your customers. Its simple, it's effective and it's the way customers want their gym! Here is our feature list which is continually growing: Manage customers Manage customer health question forms Manage customer surveys Screenshot of Customer Options Complete site statistics (graphs) membership lists Screenshot of User Statistics graphs Complete payment statistics with downloadable content to excel and csv file format. Export functions; to download customer details to create mailing lists, databases. Manage your trainers and class schedules. Class management Create recurring classes and class types Create multiple locations and trainers Create plans & passes Manage customer barcode/RFID/membership cards for customers. Customers can see their own statistics and payment history. Complete Online Store for your products, membership plans & passes.

ACKNOWLEDGEMENT

It is a genuine pleasure to express my profound gratitude and deep regard to my guide "**Mr. IRSHAD KHAN** " for their exemplary guidance, monitoring and constant encouragement.

I would like to specially thank "**Mr. Sudhakar Kumar**" our Head of the Department who gave me the golden opportunity to do this wonderful project on the topic "Gym Management system", which helped me in research and I came to know about so many things.

Chapter 4

Chapter 5

Chapter 6

Chapter 7

Ch 1. INTRODUCTION

1.1. OVERVIEW

Our Gym Management Software is a gym and health club membership management system. You can keep records on your members, their memberships, and have quick and easy communication between you and your members. Gym Management also includes a booking system, point of sale, banking, accounting, concessions and has a range of reports that help in the management of your club.

Our Gym Management Software is a complete gym and recreation facility system program which looks after all of your members, memberships and activities. It is designed for gyms, recreation centers, and health clubs. Our Gym management Software provides lots of functions such data entry of customer, keeping records of all the things about customer's fees, plan, and physical fitness which help to provide good quality of services to customer from Gym managers.

In this proposed system also provide the total information about machinery and data of coaches is also stored in it. Services provided by Gym are also handled by this system. This system structure is become very simple to understand because of Data Flow Diagram provided by us. Context level Diagram and Some chart are also available in this case study. The demo of using the software such as customer detail form, data base of software is also provided by us.

1.2. OBJECTIVES

The main objective of the Gym Management System is to manage the details of Gym. It manages all the information about Members, Staff's, Equipments. The project is totally built at administrative end and thus only the administrator is guaranteed the access.

The main objective of the project is to develop software that facilitates the data storage, data maintenance and its retrieval for the gym in an igneous way.

- To store the record of the customers, the staff that has the privileges to access, modify and delete any record and finally the service, gym provides to its customers.
- Also, only the staff has the privilege to access any database and make the required changes, if necessary.
- To develop easy-to-use software which handles the customer-staff relationship in an effective manner.
- To develop a user friendly system that requires minimal user training. Most of features and function are similar to those on any windows platform .

1.3. BENEFITS OF EXISTING SYSTEM

The project is identified by the merits of the system offered to the user. The merits of this project are as follows: -

- It's a web-enabled project.
- This project offers user to enter the data through simple and interactive forms. This is very helpful for the client to enter the desired information through so much simplicity.
- User is provided the option of monitoring the records he entered earlier. He can see the desired records with the variety of options provided by him.
- Data storage and retrieval will become faster and easier to maintain because data is stored in a systematic manner and in a single database.
- Allocating of sample results becomes much faster because at a time the user can see the records of last years.
- Easier and faster data transfer through latest technology associated with the computer and communication.
- Through these features it will increase the efficiency, accuracy and transparency.

1.4. IDENTIFICATION OF NEEDS

The existing system is a manual one. After studying the problems of the existing system, the following requirements have been identified.

- Develop a new system that will reduce the manual effort of billing.
- Develop a system that will built-up the database to facilitate future information and retrieval for analysis and other statements.
- Develop a system that will automate the monitoring of any problem during analysis.
- Develop a system that has a flexible form design.
- The system should have provision to view performance during working with system.

After completing the requirement determination and doing requirement analysis new system is designed with could solve the problem of existing system and fulfill the requirement of the users.

Ch 2. SURVEY OF TECHNOLOGY

2.1. SOFTWARE DESCRIPTION

Visual studio Code

Visual Studio Code combines the simplicity of a source code editor with powerful developer tooling, like IntelliSense code completion and debugging.

First and foremost, it is an editor that gets out of your way. The delightfully frictionless edit-build-debug cycle means less time fiddling with your environment, and more time executing on your ideas.

Languages

HTML

HTML stands for **Hypertext Markup Language**. It allows the user to create and structure sections, paragraphs, headings, links, and blockquotes for web pages and applications.

HTML is not a programming language, meaning it doesn’t have the ability to create dynamic functionality. Instead, it makes it possible to organize and format documents, similarly to Microsoft Word.

CSS

Cascading **S**tyle **S**heets, fondly referred to as CSS, is a simple design language intended to simplify the process of making web pages presentable.

CSS handles the look and feel part of a web page. Using CSS, you can control the color of the text, the style of fonts, the spacing between paragraphs, how columns are sized and laid out, what background images or colors are used, layout designs,variations in display for different devices and screen sizes as well as a variety of other effects.

JavaScript

JavaScript is a dynamic computer programming language. It is lightweight and most commonly used as a part of web pages, whose implementations allow client-side script to interact with the user and make dynamic pages. It is an interpreted programming language with object-oriented capabilities.

Why Using PHP?

There are a lot of reasons to know and love PHP, probably the most potent and valid of which is this: it’s used and runs everywhere the web does. Your cheap little $3 per month hosting account may let you run a web application in Python or Ruby if you shop carefully. But it’ll definitely run PHP. This means that you can count on it wherever you are.

And because it runs everywhere, and is easy to get started with, a lot of very popular software is written in PHP. **WordPress** is the example that’s both largest and most familiar to me, but tools like Joomla, Drupal, Magento, ExpressionEngine, vBulletin (yep, that’s still around), MediaWiki, and more are all running PHP on the server.

Why using MYSQL?

Many of the world's largest and fastest-growing organizations including Facebook, Google, Adobe, Alcatel Lucent and Zappos rely on MySQL to save time and money powering their high-volume Web sites, business-critical systems and packaged software.

Since then, the performance & scalability, reliability, and ease of use of the world's most **popular** open source database, characteristics that made **MySQL** the #1 choice for web applications, have relentlessly been improved.

Ch 3. REQUIREMENT AND ANALYSIS

3.1. FEASIBILITY STUDY

To evaluate feasibility, a feasibility study is performed, which determines whether the solution considered to accomplish the requirements is practical and workable in the software. Information such as resource availability, cost estimation for software development, benefits of the software to the organization after it is developed and cost to be incurred on its maintenance are considered during the feasibility study. The objective of the feasibility study is to establish the reasons for developing the software that is acceptable to users, adaptable to change and conformable to established standards.

System analysis

Gather, analyze, and validate the information.Define the requirements and prototypes for new system.

Hardware and software study

The hardware and software is developed or maintained for the smooth running of the project.

System design

The design phase comes after a good understanding of customer's requirements, this phase defines the elements of a system, the components, the security level, modules, architecture and the different interfaces and type of data that goes through the system. **System testing and implementation**

Testing is becoming more and more important to ensure customer's satisfaction, and it requires no knowledge in coding, hardware configuration or design.In this phase, the system is ready to be deployed and installed in customer's premises.

Evalutaion

This phase identifies whether the system meets the initial requirements and objectives. This is when the system is evaluated for weaknesses. The objective of the evaluation phase of the systems development life cycle is to deploy the system and train the system end users.

Maintenance and modification

In this phase, periodic maintenance for the system will be carried out to make sure that the system won't become obsolete, this will include replacing the old hardware and continuously evaluating system's performance, it also includes providing latest updates for certain components to make sure meets the right standards and the latest technologies to face current security threats.

3.2. HARDWARE AND SOFTWARE REQUIREMENTS

Hardware Requirement :-

- Dual core processor and above
- 2GB of RAM & above
- 20GB of hard disk & above

Software Requirement :-

- PHP
- Any Operating System
- Apache Server
- MySQL Databases
- HTML, CSS, Javascript

- Any Web Browser

3.3 DATA FLOW DIAGRAM

DFD is an important tool used by system analysis. A data flow diagram model, a system using external entities from which data flows through a process which transforms the data and creates output data transforms which go to other processes external entities such as files. The main merit of DFD is that it can provide an overview of what data a system would process.

Ch.4. SYSTEM DESIGN

Software design sits at the technical kernel of the software engineering process and is applied regardless of the development paradigm and area of application. Design is the first step in the development phase for any engineered product or system. The designer's goal is to produce a model or representation of an entity that will later be built. Beginning, once system requirement have been specified and analyzed, system design is the first of the three technical activities design, code and test that is required to build and verify software.

The importance can be stated with a single word "Quality". Design is the place where quality is fostered in software development. Design provides us with representations of software that can assess for quality. Design is the only way that we can accurately translate a customer's view into a finished software product or system. Software design serves as a foundation for all the software engineering steps that follow. Without a strong design we risk building an unstable system – one that will be difficult to test, one whose quality cannot be assessed until the last stage.

During design, progressive refinement of data structure, program structure, and procedural details are developed reviewed and documented. System design can be viewed from either technical or project management perspective. From the technical point of view, design is comprised of four activities – architectural design, data structure design, interface design and procedural design.

4.3 DATA DICTIONARY

The data in the system has to be stored and retrieved from database. Designing the database is part of system design. Data elements and data structures to be stored have been identified at analysis stage. They are structured and put together to design the data storage and retrieval system.

A database is a collection of interrelated data stored with minimum redundancy to serve many users quickly and efficiently. The general objective is to make database access easy, quick, inexpensive and flexible for the user. Relationships are established between the data items and unnecessary data items are removed. Normalization is done to get an internal consistency of data and to have minimum redundancy and maximum stability. This ensures minimizing data storage required, minimizing chances of data inconsistencies and optimizing for updates. The MS Access database has been chosen for developing the relevant databases.

Database tables :

5.2. TESTING APPROACH

Types Of Testing

The system was designed according to the requirement of the system. But we are not 100% confidants. The lack of confidence stems from several things. First the system deals with large number of states, complex logic and activities. So some error might occur in the system. Error may be software, which is known as "SOFTWARE ERROR" i.e. the software doesn’t do what the requirement says. So and exhaustive and thorough testing must be conducted to ascertain. Whether the system produces right results. The project guide and the user both did testing.

Module Testing

The testing was done and several stages. First each program module was tested as a single program, which is also known as module testing or unit testing. In unit testing asset of data as input was given to the module and observed what output data is produced. In addition, the logic and boundary condition for input and output data was also checked. The interface between this module and others was checked for correctness. While collecting the input data for testing the program module it was kept in mind that input should be from all classes, so the entire condition of the program could also be checked.

Interogating Testing

When the individual program modules were working properly, we combine the module in the working system. This integration is planned and coordinated so that when an error occurs, we have an idea of what caused it. Integration testing is the process of verifying that the components of a system work together as described in the program design specification. For testing, the system was viewed as a hierarchy of modules. We began with the module at the highest level of design and worked down. The next modules to be tested are those that call previously tested modules.

Function Testing

Once we sure that information is passed among modules according to the design prescription we tested the system to assure whether the function described the requirement specification are actually performed by the integrated system.

Acceptance Test

When the function test completes then we involved the user to make sure that system works according to the user’s expectation. Thus, the user did the acceptance test.

Implementation

Once the system was tested (module wise as well as integrated) satisfactorily, and then comes the implementation of the system. Implementation is the process of changing from old system (manual) to the new system (computerized). Some training was also given to the user about how to work on the new system and finally the system was successfully adopted.

5.3. VALIDATION CHECK

The basic objective of the requirement validation activity is to ensure that "Bus ticket booking Management System" reflects the actual requirements accurately and clearly. Checking data for appropriateness and accuracy is called validating. Data entry checks can be built into the database packages to present invalid data from being entered. For instance, in database, format checking (determining if the data are in the correct format) is done automatically because at the time of creating a database file.

Range checking (determining if the data fall within an acceptable range) and accuracy checking (making sure that an entry is possible) can be built by writing a simple program in database.

Ch 7. CONCLUSION

7.1. LIMITATIONS

- The size of the database increases day-by-day, increasing the load on the database back up and data maintenance activity.
- Training for simple computer operations is necessary for the users working on the system.
- It don't have any industrial implementation, it is just applicable to be implemented for small shops to main its shops products details and for providing bills to the customer.

7.2. FURTHER SCOPE

We think that not a single project is ever considered as complete forever.Because our mind is always thinking something new and our necessities also are growing day by day.We always want something more than what wehave.Our application also,If you see at the first glance then you find it to be complete but we want to make it still mature and fully automatically.The future perspective of our project is to manage a gym automatically by adding sensor id's.Making a mobile app for the user is also a first step development.we can also change the security of the software over the time, because by the time software will hav emore and more secure as the data also secure.

7.3. CONCLUSION

It can be observed that computer applications are very important in every field of human endeavor. Here all the information about customer that made reservation can be gotten just by clicking a button with this new system, some of the difficulties encountered with the manual system are overcome. It will also reduce the workload of the staff, reduce the time used for making reservation at the bus terminal and also increase efficiency. The application also has the ability to update records in various files automatically thereby relieving the company's staff the stress of working from file security of data
